Download Notes:
Next Finish Finish & New Cancel

Click on this link to begin downloading the 1048.zip file. This could take 20-60 minutes to download and you may only see a blank screen (look for your downloads window to confirm).

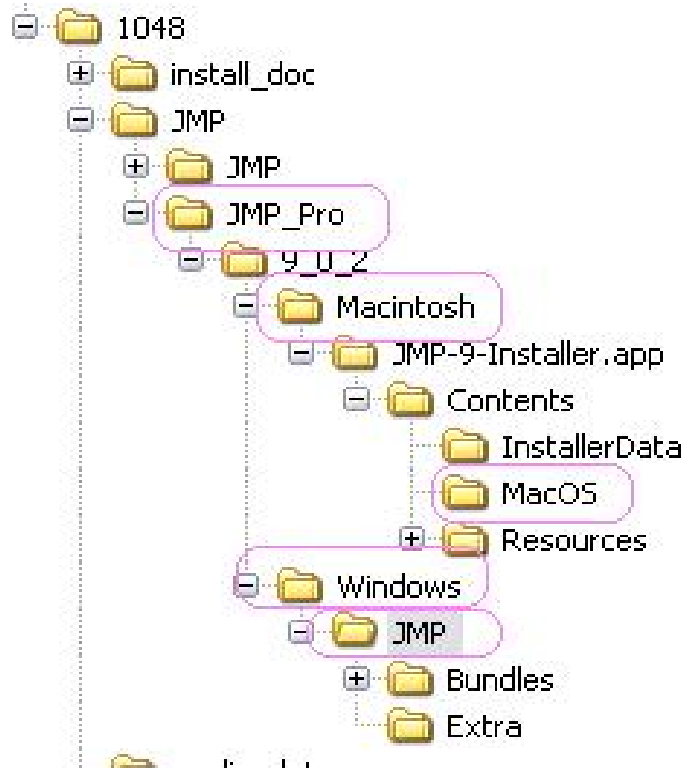

The link allows you to download a compressed ZIP folder that contains the program files, click the link to start the download process. The compressed ZIP folder is larger, and may take 10-20 minutes depending on your network connection (wireless networks are not recommended).

After downloading the ZIP file, select *Next* and *Finish* to officially send the request so the university can keep track of installations. You should receive an email confirmation from srs-svcrequest@calpoly.edu which contains license files and installation instructions.

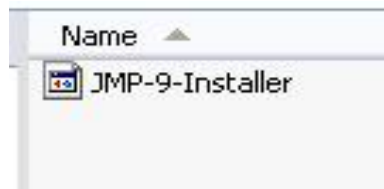

Windows users: You will still need to indicate that you want the "windows" and "pro" version.

For example, you can right click on the file then select PKzip > Extract Here

Depending on your operating system and settings, you may need to decompress the ZIP folder once it is downloaded (eg using Windows XP) and extract the parent *1048* folder. Open the parent folder *1048*. This contains an executable *setup.exe*, this is **not** the installation executable you need to install JMP Pro (or JMP). The installation executable you need is specific to your operating system and can be found in the appropriate child folder.

- For Macintosh, the folder *MacOS* contains the installation executable *JMP-9-Installer*.

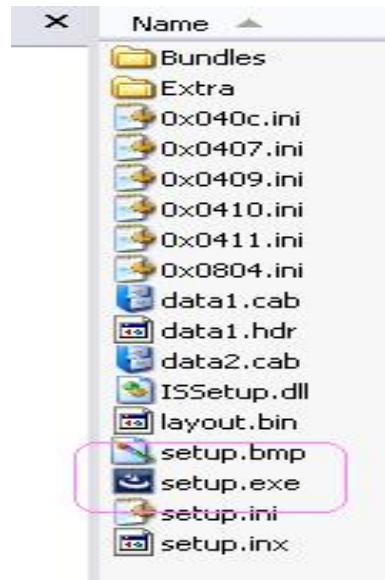

double click on this file and then press Install

After running the installation executable, you will be prompted to select a license file to complete the installation. Use the file that ends in *2408_OSX_X86-64.txt*.

If this doesn't work (not valid for your version of macintosh) then try the file ending in *OSX-X86-32.txt*

- For Windows, the folder *JMP* contains the installation executable *setup.exe*. On some Windows operating systems, the installer may need to install a version of *Microsoft .NET Framework* before installation. (Say Yes if prompted)

Double click on the *setup.exe* file and then press Run. This will open an InstallShield Wizard and you should be able to select all the default options (keep pressing Next and then Install) and click Finish. After installation, you will probably need to restart your computer.

After running the installation executable, your computer may automatically identify and use the necessary license file. If you are asked to select a license file, use the file that ends in *12407_Win_X64.txt*.

In the event that you are prompted to supply a license file, these are available three locations. They are available in the child *sid_files* folder of the parent *1048* folder. They are also contained in the confirmation email you should receive, and by viewing the software request form through your *my.calpoly.edu* portal (*Technical Service Request > My Items > My Software Request*).

You may receive a notification when you first open JMP that the license has expired. If this happens, you need to go back to the portal or to a follow-up email that lists the individual license files, download the appropriate one and that point JMP to that.
